This Atlas of Pathology is intended for medical students, residents, fellows, pathologists and physicians interested in Pathology. This book series is intended chiefly for use by pathologists in training and practicing surgical pathologists in their daily practice. It is arranged by organ systems and also includes chapters on external examination findings, the effect of decomposition, and histopathological findings, as well as procedures and devices one may encounter during autopsy. Within you will find microscopic explained images of basic pathology lesions along with accompanying text. Each atlas will offer the reader a quick reference guide for diagnosis and classification of a wide spectrum of benign, congenital, inflammatory, nonneoplastic, and neoplastic lesions in various organ systems. The first Section will include normal histology and normal variations. It covers both diseases that are commonly seen as well as less common, or even rare, diseases. The atlas series will also be a useful resource for medical students, cytotechnologists, pathologist assistants, and other medical professionals with special interest in anatomic pathology. Each volume in this series will be authored by nationally and internationally recognized pathologists. The third Section will cover benign and inflammatory lesions. The book includes a series of more than 700 color clinical images of adult autopsy pathology. Thank you for visiting. It features concise guidance on how to interpret macroscopic findings and prompts when further considerations are useful. The book is also an important reference for anatomical pathology technicians, medico-legal specialists, and their officers. The detailed figure legends will concisely summarize the critical information and visual diagnostic criteria that the pathologist must recognize, understand, and accurately interpret to arrive at a correct diagnosis. Special emphasis will be placed on normal histology, gross anatomy, and gross lesion appearances since these are generally lacking or inadequately illustrated in current textbooks. External Examination: Natural Disease and Common Artifacts External Examination: Trauma The Cardiovascular System The Respiratory System The Gastrointestinal System The Hepatobiliary System and Pancreas The Genitourinary System The Endocrine System The Lymphoreticular System The Locomotor System The Central Nervous System Decomposed Bodies Histology of the Autopsy Medical Procedures and Devices Encountered at Autopsy This atlas is more than a collection of images. Each volume will follow the same organizational structure. Covering all major topic areas in organ system pathology and incorporating the latest understanding of pathophysiology and molecular medicine, it is a quick visual reference or review for students and professionals alike. This atlas is designed to be a visual reference that can assist with rapid diagnosis of autopsy findings. Welcome to the Atlas of Pathology website. Macroscopic and histological images are aesthetically pleasing in many ways. In some instances, a diagnosis may be made on the basis of the macroscopic appearance alone, while in others further investigation is required and appropriate guidance is provided. Each atlas will focus on visual diagnostic criteria and differential diagnosis. Unlike other atlases, this book goes beyond simply providing a collection of images. Normal and variations of "normal" histology will also be illustrated. It provides reliable instruction on the interpretation of macroscopic findings. ... [and] represents a wealth of information for medical students, pathology trainees, more experienced pathologists, and physicians interested in pathology." —Sherry Krawitz, MD, PhD, University of Manitoba College of Medicine in Doody's Book Reviews This new series will serve as a virtual pathology museum for the edification of our readers. It will be organized to provide quick access to images of lesions in specific organs or sites. Comprehensive in its coverage with high-quality illustrations, this definitive atlas is an invaluable resource to trainees and consultant pathologists performing non-forensic autopsies. It should serve as a supporting photo atlas of pathology to enhance the observer's knowledge. The fourth Section will cover benign tumors and benign mimickers of cancer. Each atlas will adapt the well-known and widely accepted terminology, nomenclature, classification schemes, and staging algorithms.
